About

This manual for the open source mobile project **Monkey Clicks** that aim to make it fast and easy to create mobile apps without writing code! Sure for coders they have the option to custom the code.

Monkey Clicks is based on three applications:

- **Tree:** Tree version is content application that read information from offline database.
- **Parse:** Parse version read information from online APIs.
- **Piczo:** Piczo version is for photo gallery apps.

All the three projects support ads and social share features.

This manual describe the **Tree** android application V1 from Monkey Clicks projects

Application features

- Handle multiple screens and orientations.
- Read data from database.
- Add items to favorite.
- Support Google admonb ads.
- Share on social media.

This manual describe the **Tree** android application V1 from Monkey Clicks projects

How To

Three easy steps to create your android:

1. **Import** the project into Eclipse
2. **Rename**
 - a. Rename the application name from res > values > strings.xml
 - b. Rename the package name from AndroidManifest.xml
3. **Fill** the data into the database file data.sqlite inside res folder using any preferred SQLite browser application

If the tutorial link does not work go to:

<http://codk.tumblr.com/post/83727645411/android-template>

Advanced

- **Ads:** The application support ads from Admob, create ads units in Admob then set banner_id and interstitial_Id fields in res > values > config.xml
- **Right to left:** The application support right to left languages, to make the application right to left go to res > values > config.xml and set is_right_to_left = true
